Subject: Programming with Java

ASSIGNMENT No : 13

TITLE : File Handling in Java

Problem Statement

Write a Java program to perform reading from and writing to a file using file handling operations.

Learning Objectives

To perform file reading and writing operations using Java file handling classes.

Theory

Java provides file handling through the java.io package. Classes such as File, FileReader, FileWriter, BufferedReader, and BufferedWriter are used to perform input and output operations. File handling enables permanent storage and retrieval of application data. Proper exception handling is necessary to manage file-related errors. These concepts are essential for data persistence.

Programme

1. Create a program to write and read **employee details from a file**.

```
import java.io.FileWriter;
import java.io.FileReader;
import java.io.IOException;

public class EmployeeFile {

    public static void main(String[] args) {

        try {

            // Writing employee details to file
```

```

FileWriter writer = new FileWriter("employee.txt");

writer.write("Employee ID: 101\n");
writer.write("Employee Name: Anurag\n");
writer.write("Department: Computer Science\n");
writer.write("Salary: 40000\n");

writer.close();

System.out.println("Employee details written successfully.");

// Reading employee details from file
FileReader reader = new FileReader("employee.txt");

int ch;

System.out.println("\nEmployee Details:");

while ((ch = reader.read()) != -1) {
    System.out.print((char) ch);
}

reader.close();

} catch (IOException e) {

    System.out.println("Error: " + e.getMessage());
}
}
}

```

2. Create a Java program to write **patient details** (patient ID, name, age, and diagnosis) to a file and read the details from the file for display.

```
import java.io.FileWriter;
```

```
import java.io.FileReader;
import java.io.IOException;

public class PatientFile {

    public static void main(String[] args) {

        try {

            // Writing patient details to file
            FileWriter writer = new FileWriter("patient.txt");

            writer.write("Patient ID: 201\n");
            writer.write("Patient Name: Rahul\n");
            writer.write("Age: 25\n");
            writer.write("Diagnosis: Fever\n");

            writer.close();

            System.out.println("Patient details written successfully.");

            // Reading patient details from file
            FileReader reader = new FileReader("patient.txt");

            int ch;

            System.out.println("\nPatient Details:");

            while ((ch = reader.read()) != -1) {
                System.out.print((char) ch);
            }

            reader.close();
```

```

    } catch (IOException e) {

        System.out.println("Error: " + e.getMessage());
    }
}
}

```

Output

```

cd "/Users/rakeshkumarchaudhary/assignment13/" && javac Employee1
rakeshkumarchaudhary@RAKESHs-MacBook-Air assignment13 % cd "/Users,
rakeshkumarchaudhary@RAKESHs-MacBook-Air assignment13 % cd "/Users,
efile
Employee details written successfully.

Employee Details:
Employee ID: 101
Employee Name: Anurag
Department: Computer Science
Salary: 40000
rakeshkumarchaudhary@RAKESHs-MacBook-Air assignment13 %

rakeshkumarchaudhary@RAKESHs-MacBook-Air assignment13 % cd "/Users/r
cd "/Users/rakeshkumarchaudhary/assignment13/" && javac PatientFile.
rakeshkumarchaudhary@RAKESHs-MacBook-Air assignment13 % cd "/Users/r
ile
Patient details written successfully.

Patient Details:
Patient ID: 201
Patient Name: Rahul
Age: 25
Diagnosis: Fever
rakeshkumarchaudhary@RAKESHs-MacBook-Air assignment13 %

```

Conclusion

In this practical, I learned how to perform **file reading and writing operations in Java** using `FileWriter` and `FileReader`. I successfully stored employee and patient details in files and then read the data from the files for display. This practical helped me understand how Java file handling can be used to store and retrieve data efficiently.
